

# Economic and environmental impacts of PEP2040

## About us

- Energy Forum is a think tank operating in the field of energy
- Our mission is to lay the foundations for effective, safe, clean and innovative energy sector based on data and analysis

## Strategic orientations

- Reliability of Poland's power system
- Reducing the environmental impact of the energy sector
- Energy efficiency and the role of a consumer

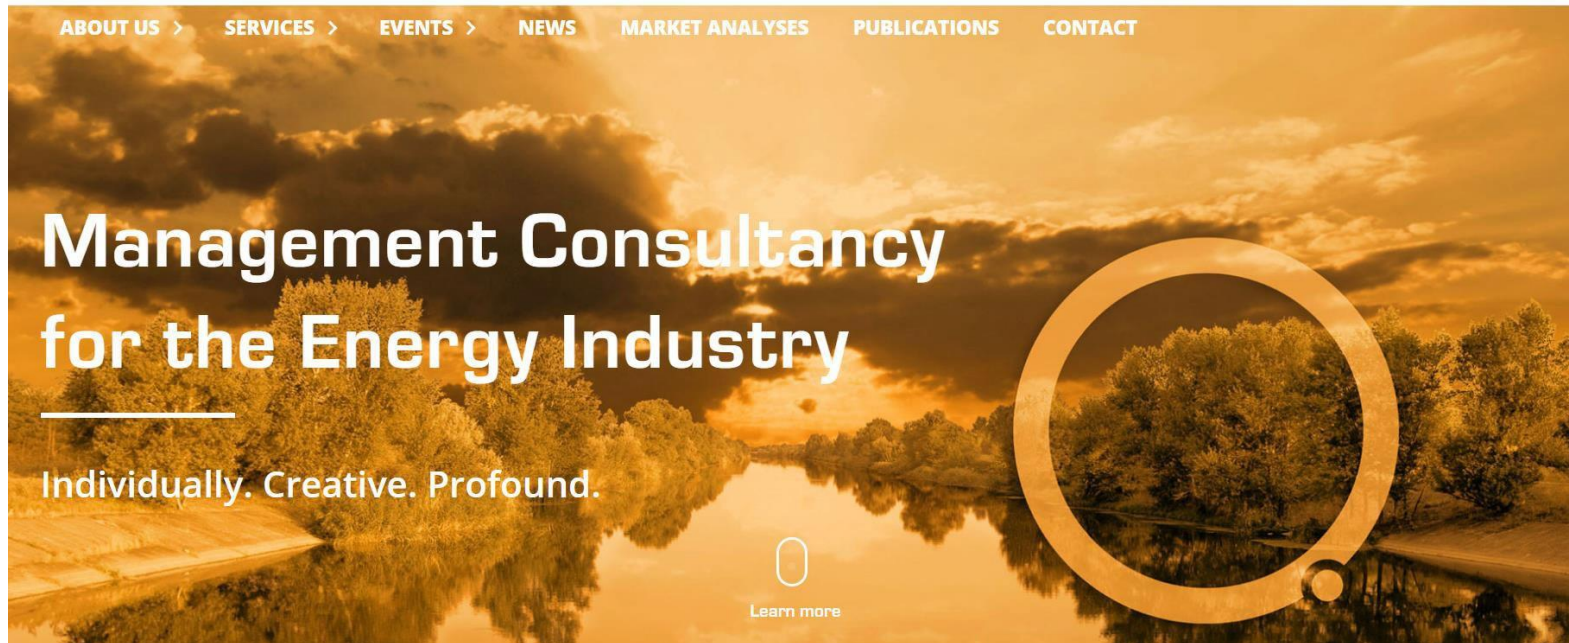

# Purpose of the analysis

- Assessment of economic and environmental impacts of the scenario PEP 2040 (ME)
- Analysis and presentation of an alternative scenario
  - Wholesale electricity prices
  - Energy generation costs
  - CO<sub>2</sub> and other emissions
  - Fuels

# Cooperation

- Modelling and forecasting of the electricity market in Europe
- Electricity, gas, heat and CO<sub>2</sub> markets in Europe and worldwide
- Sectors: energy, transport, networks
- Consulting for energy and other companies

# Working method

- 1) Analysis of the Ministry of Energy scenario – **PEP2040 (ME)**
- 2) Verification of the PEP2040 (ME) scenario – **PEP2040 (e)** is created
- 3) Development of assumptions for scenario assessment – fuel prices, CO<sub>2</sub>, etc.
- 4) Development of an "**alternative scenario**":
  - without nuclear
  - with a faster phase out of lignite
  - gas, wind and solar power plants selected with the use of cost optimization method
- 5) Economic dispatch modelling

## Challenges:

- the Ministry of Energy scenario does not take into account cross-border exchanges
- a reference to the costs of network development
- nuclear dilemmas

# Assumptions

Main model parameters	PEP2040	Alternative scenario
<b>Prices of fuels and CO<sub>2</sub></b>	Until 2021, futures contracts concluded in the fourth quarter of 2018; “New Policies” scenario IEA, WEO 2018.	
<b>Nuclear power</b>	Launch of the first unit in 2033; 7.5 GW in total after 2040	Without nuclear power
<b>Lignite</b>	Replacement of lignite with nuclear energy. To remain: <ul style="list-style-type: none"> <li>• 2030: 7.5 GW</li> <li>• 2040: 1.5 GW</li> </ul>	Phasing out of lignite in accordance with the expected depletion of exploited deposits. To remain: <ul style="list-style-type: none"> <li>• 2030: 2 GW</li> <li>• 2040: 0.5 GW</li> </ul>
<b>Hard coal</b>	Units currently under construction, maintenance of CHP at 6 GW, withdrawal of old units <ul style="list-style-type: none"> <li>• 2030: 18.5 GW (3.7 GW currently under construction)</li> <li>• 2040: 12 GW</li> </ul>	Units modernized and included in the capacity market <ul style="list-style-type: none"> <li>• 2030: 13 GW</li> <li>• 2040: 7 GW</li> <li>• 2050: 4 GW (only units constructed after 2018)</li> </ul>
<b>Gas</b>	<ul style="list-style-type: none"> <li>• 2030: 6 GW</li> <li>• 2040: 10 GW</li> </ul>	According to cost optimization, mainly CHP: <ul style="list-style-type: none"> <li>• 2030: 16 GW</li> <li>• 2040: 20 GW</li> </ul>
<b>RES</b>	In 2040: <ul style="list-style-type: none"> <li>• PV 20 GW</li> <li>• Offshore 10 GW</li> <li>• No new investments in onshore; phase-out until 2045</li> </ul>	In 2040: <ul style="list-style-type: none"> <li>• PV 20 GW + cost optimization</li> <li>• Offshore 10 GW</li> <li>• Onshore 24 GW (cost optimization)</li> </ul>
<b>Demand for electricity</b>	Average increase by 1.7%, i.e. up to 230 TWh in 2040 in accordance with the PEP2040 assumptions, among other things, due to the increase of GDP, e-mobility etc. adopted by the Ministry of Energy.	

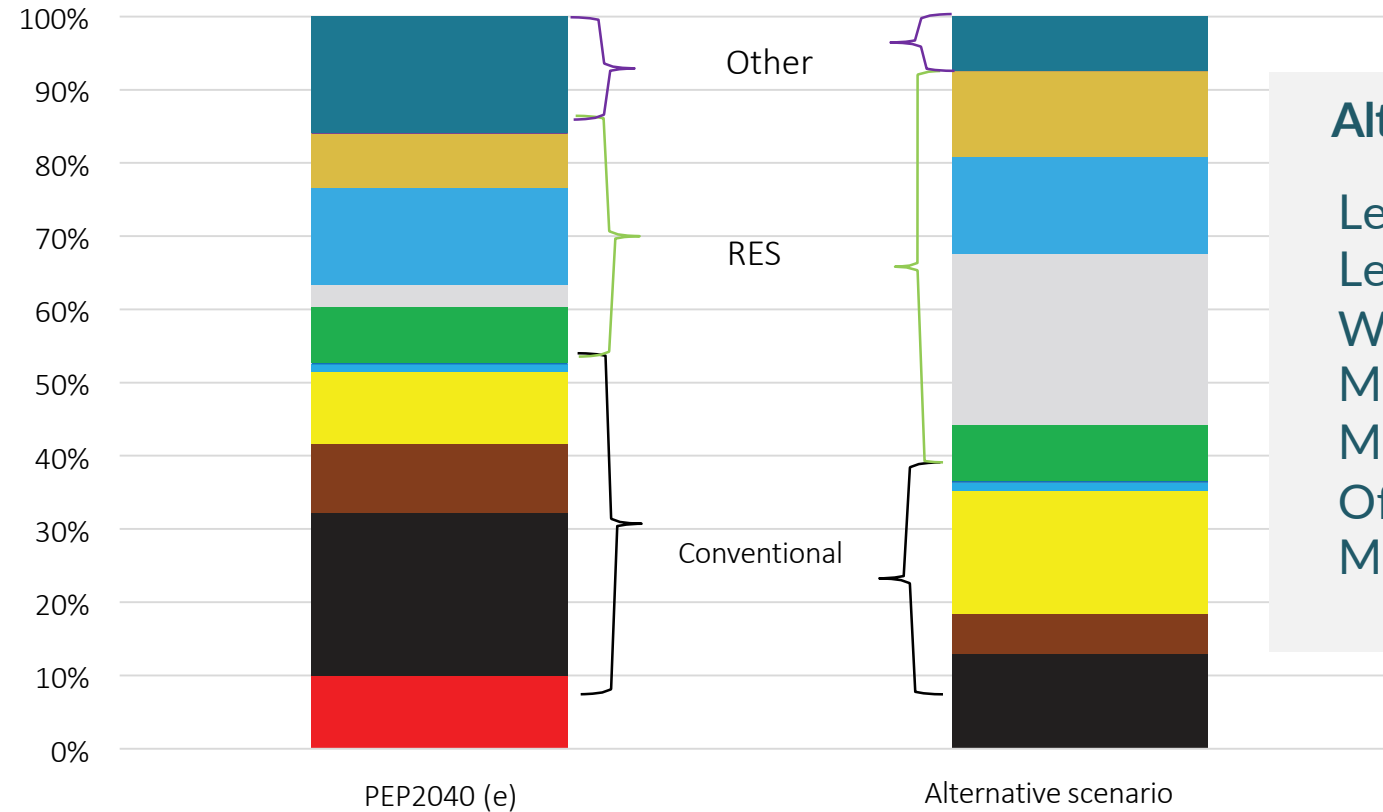

# Technology costs – LCOE

## Change in costs by 2050

PV	46%	↓
Offshore	45%	↓
Onshore	21%	↓
Nuclear	no change	
Gas	30%	↑
Hard coal	29%	↑
Lignite	46%	↑

# Cumulative electricity production up to 2050

**Alternative scenario**

- Less net imports 9% ↓
- Less coal 8% ↓
- Without nuclear
- More PV ↑ 6%
- More wind ↑ 27%
- Offshore same level
- More gas (due to CHP) ↑ 7%

- nuclear
- gas
- biomass
- DSR
- hard coal
- gas (EC)
- onshore wind
- hard coal (EC)
- hydro
- offshore wind
- lignite
- pumped storage
- photovoltaics
- net imports

# Installed capacity

## PEP2040 (e)

## Alternative scenario

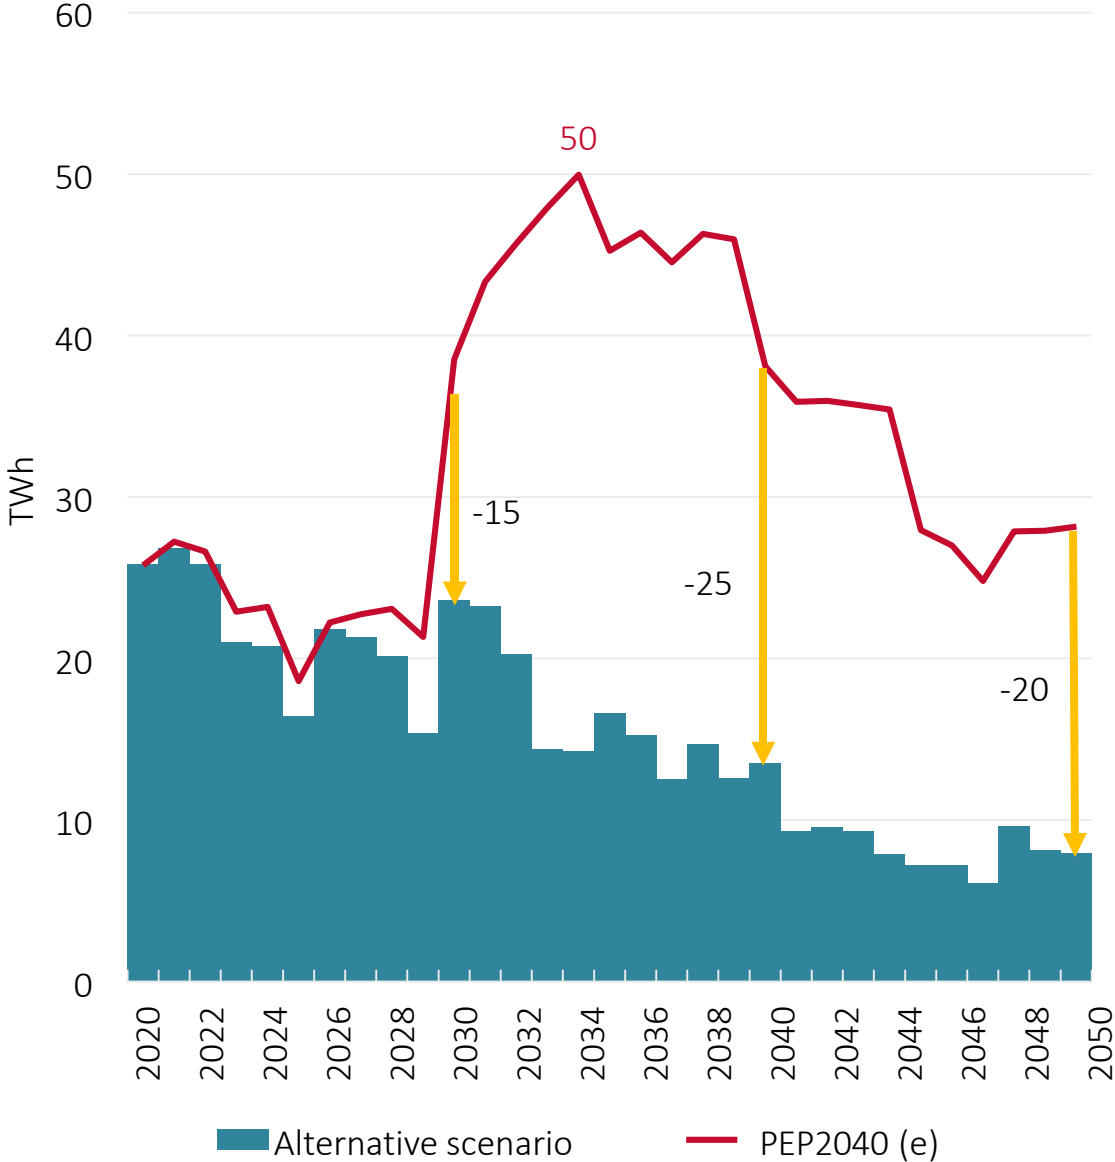

# Production of electricity

## PEP2040 (e)

## Alternative scenario

# Balance of electricity imports

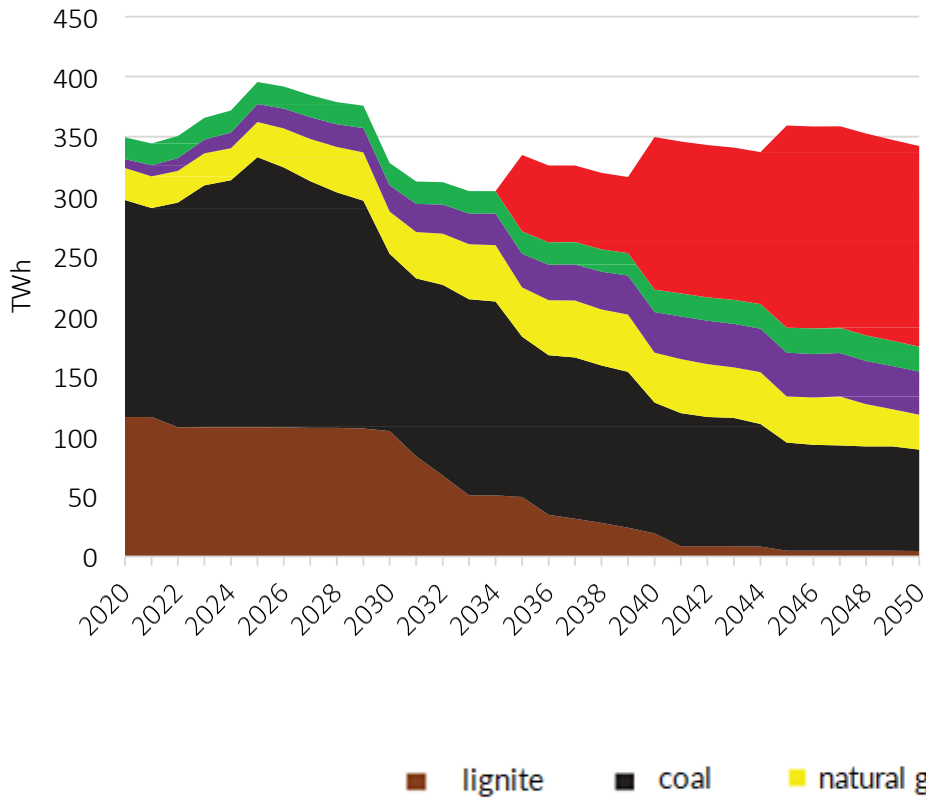

The alternative scenario allows for a 54% reduction in imports over the whole period.

PEP2040 (e) scenario in the peak demand period requires approx. 50 TWh of imports.

# Primary energy in fuels

## PEP 2040 (e)

## Alternative scenario

# CO<sub>2</sub> emissions

## Alternative scenario:

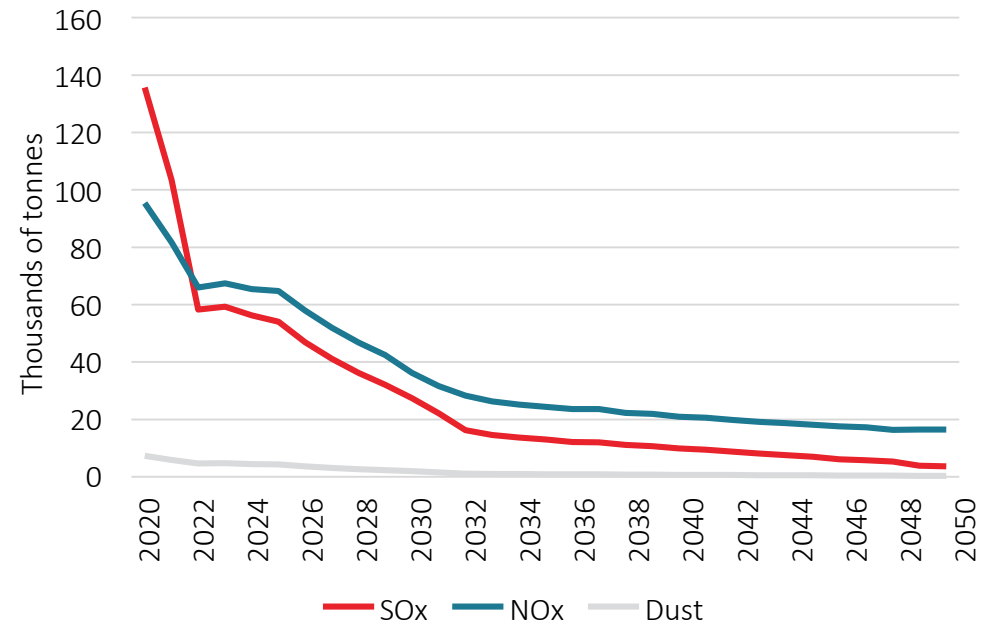

- 29% less CO<sub>2</sub> emissions than in PEP2040 (e)
- in 2026 the emissivity falls below 550 g/kWh

# Other emissions

## PEP 2040 (e)

## Alternative scenario

The decrease in SOx and NOx emissions is due to the adjustment of all units to emission standards (BREF conclusions).

# Generation costs

## PEP2040 (e)

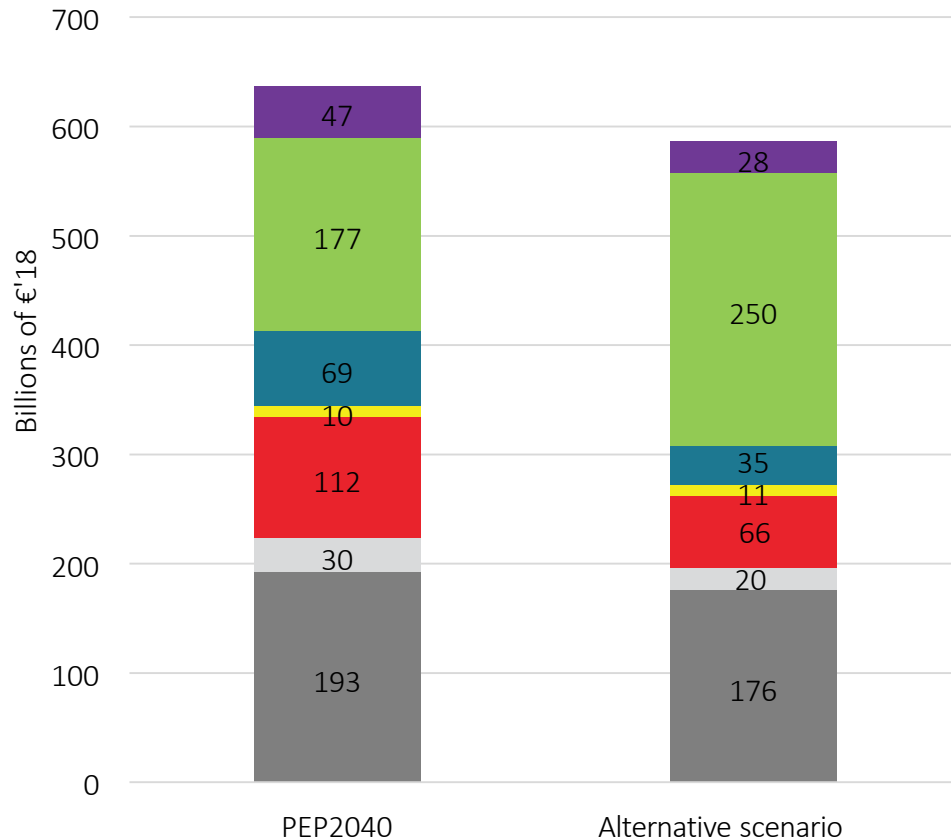

## Alternative scenario

- the OPEX and CAPEX categories represent costs of conventional technologies
- RES – total CAPEX + OPEX

# Total costs

## Accumulated cost

## Comparison of cost difference

OPEX variable
  OPEX fixed
  CAPEX
  Backup
  Import (balance)
  RES
  External cost

# Wholesale prices

# Wholesale prices – comparison of scenarios

# Conclusions

- Insufficient reference to EU regulations
- Lack of costs optimization
- Electricity demand projection does not result from activities towards electrification of heating and transport
- Lack of strategy regarding electricity imports
- Lack of a reliable fuel balance
- No reference to the functioning of the energy market
- Too little reference to district heating

# Risks

- Delays in commissioning of nuclear power plants, adequacy problems after lignite phase out
- Costs and wholesale prices
- Unlimited imports of electricity

Thank you for your attention
